

Poverty and Child Health after the 2008 Global Financial Crisis: Thoughts Emerging from Analyses of Data from the QLSCD

*(Québec Longitudinal Study of Child Development /
Enquête longitudinale du développement des enfants du Québec-ELDEQ)*

Lise Gauvin PhD

Beatrice Nikiéma MD MSc

Louise Séguin MD MSc

Puzzling Findings on the Health Impact of the 2008 Global Financial Crisis (GFC)

Objectives of the Analyses

- Describe how the proportion of deprived households evolved between 2008 and 2014 in the QLSCD (*Québec Longitudinal Study of Child Development*).
- Describe how health evolved from 2008 to 2014 among children in the QLSCD as a function of deprivation
- Examine how deprivation and child health are associated between 2008 and 2014 while controlling for previous deprivation.

Data

- The QLSCD (*Québec Longitudinal Study on Child Development*)
 - A prospective birth cohort started in 1998
 - Annual or biennial follow-ups of 2120 children who were 5 months old in 1998 (initial participation rate: 83%)
 - Interviewer-administrated questionnaires & self-administrated (parents, teacher, & child) reports
 - Birth data extracted from hospital charts

Participation Rates across Time

Participation rates at follow-up

Measures of Deprivation

- Poverty
 - Household income below the Canadian before taxes cut-offs (LICO)
- Willms' index of SocioEconomic Status (SES) (selected results)
 - A composite standardized score (transformed into quintiles) based on
 - Parent's highest education level
 - Household income
 - Prestige of the parent's occupation (the highest)
- Social welfare as main source of income (not shown)

Child Health Indicators

- Perceived health status (Parent reports)
- Depressive symptoms (Child reports)
- Proactive aggressive behavior (Child reports)

Perceived Health

- Rated by the person most knowledgeable about the child
- At each occasion since baseline

– *In general, would you say that [1st name]'s health is*

Excellent

Very good

Good

Fair

Bad ?

- Dichotomized (***Less than Very Good*** vs. **Very Good-Excellent**)

Youth Self-rated Depression Symptoms

Children Depression Inventory (CDI – Kovacs, 1985)

- 8 Sets of Depression Symptoms in the previous 2 weeks from the according to 3 levels severity
- Scores summed and standardized
(0 to 10 with higher scores = higher level of depressive symptoms)
- Measured in 2008, 2010, & 2011

Youth Self-rated Proactive Aggression

Items from the 6th cycle of the NLSCY

- Frequency *Never (1) Sometimes(2) or Often(3)* of 4 Proactive Aggressive Behaviors:
 - Threaten to hit people
 - Encourage other children to pick on a particular child
 - Try to dominate other children
 - Scare other children to get what you want.
- Scores summed and standardized (0) (0 to 10 with higher scores = more aggressive behavior)
- Measured in 2008, 2010, & 2011

Analyses

- Description of evolution of Low-Income Households, SES, & Receipt of Social Welfare
 - Plotting of estimates
 - Joinpoint analysis
 - Latent growth curves analysis: *1998-2007 Deprivation Trajectories*
- Associations between Deprivation & Child Health data collected in 2008, 2010, 2011, & 2013:
 - Multilevel Logistic Regressions: *Perceived Health*
 - Multilevel Poisson Regressions: *Depression & Proactive Aggression*
 - Concurrent & lagged associations

Handling of Missing Data

- Evidence of differential attrition (*i.e., Poor, single-parent-families overrepresented*)
- Applied occasion-specific weights
 - Constructed at each measurement occasion
 - Using the response propensity stratification method
 - Adjusted using administrative data
- Multiple imputation not used
 - Not aware of any procedure for combining time-varying weights with multiple imputation
 - Inclusion of time-invariant sampling weights still under discussion

Results

How Exposure to Low-Income evolved among QLSCD families between 1998-2013?

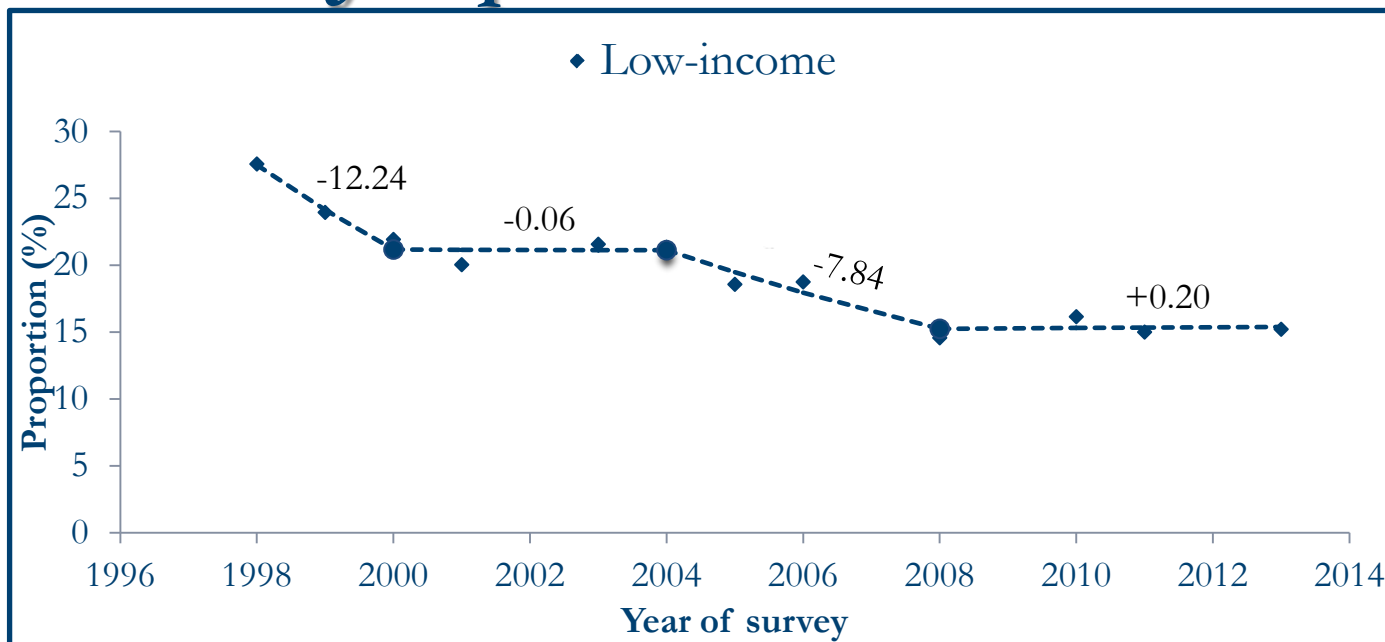

CRCHUM

Université 
de Montréal

Weighted Proportion of **Low-Income Households**, QLSCD (1998-2013)

Trend of Low-Income Households : Joinpoint Estimates

Circles = Joinpoints;

Values = Annual percent change in the time trend;

* Change is significantly different from zero (Alpha=0.05).

Weighted Proportion of Low-Income Households as a function of Type of Family, QLSCD (1998-2013)

Trend of Low-Income Households by Type of Family: Joinpoint Estimates

Circles = Joinpoints;

Values = Annual percent change in the time trend;

* Change is significantly different from zero (Alpha=0.05).

Weighted Proportion of **Low-Income Households, QLSCD** (1998-2013) as a function of Mother's Immigration Status

Trend of **Low-Income Households** as a function of **Mother's Immigration Status : Joinpoint Estimates**

Circles= Joinpoints;

Values = Annual percent change in the time trend;

* Change is significantly different from zero (Alpha=0.05).

Weighted Proportion of **Low-Income Households** as a function of **Mother's Education Level**, QLSCD (1998-2013)

Trend of **Low-Income Households** as a function of Maternal Education: Joinpoint Estimates

Circles= Joinpoints;

Values = Annual percent change in the time trend;

* Change is significantly different from zero (Alpha=0.05).

Interpretation

How Exposure to Low-Income evolved among QLSCD families between 1998-2013?

CRCHUM

Université 
de Montréal

Interpretation: GFC as experienced in Québec & Deprivation among QLSCD Families

- In the Entire Cohort

- Statistically **non-significant change** in the proportion of households with low-income from 2008 to 2013.

- Among Subgroups

- Among 2-parent families, single-mother families, & families with non-European immigrant mothers, **significant decrease** in poverty from 2000 to 2013
- Among families with mothers with no high school diploma, **significant increase** in poverty between 2008 and 2013

Results

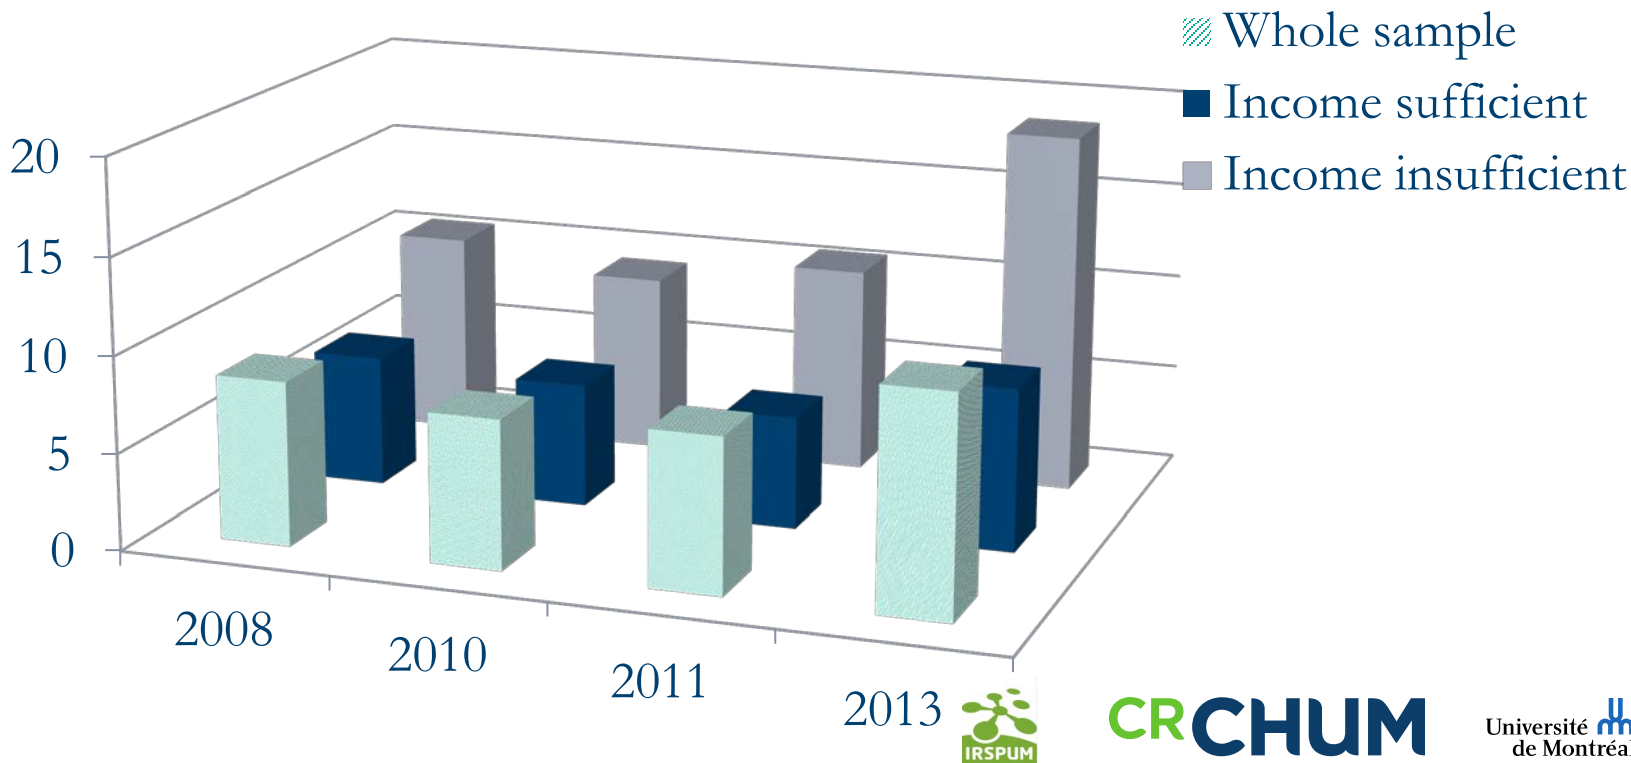

How Health evolved from 2008
to 2014 among Children in
the QLSCD as a function of
Poverty

CRCHUM

Université 
de Montréal

Proportion of Children Perceived as being in Less than Very Good Health in the Entire Sample and as a function of Income Level

Being Perceived in Less than Very Good Health: Identifying If and When Change Occurred (Joinpoint estimates)

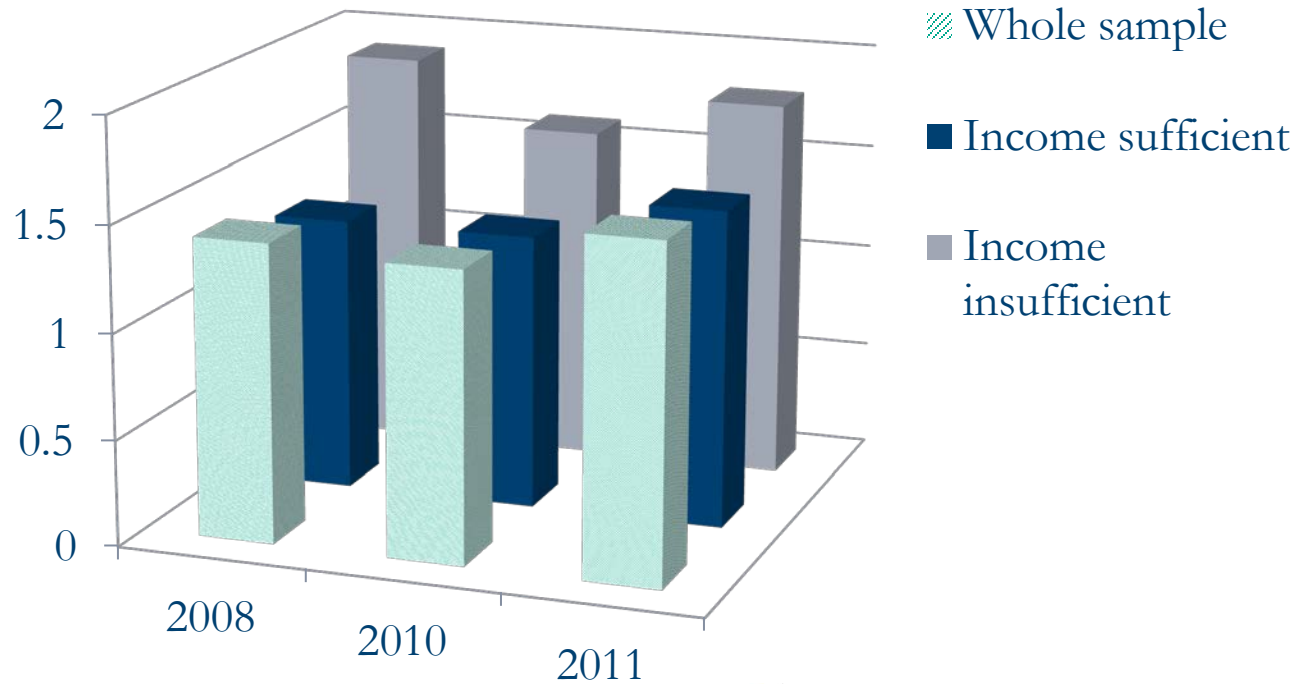

Circles= Jointpoints;

Values = Annual percent change in the time trend;

* Change is significantly different from zero (Alpha=0.05).

Mean Youth Self-rated Score of Depression Symptoms in Entire Sample & as a function of Income Level

Mean Youth Self-rated Score of

Proactive Aggression Behavior in the Entire Sample & as a function of Income Level

Interpretation

How Health evolved from 2008
to 2014 among Children in
the QLSCD as a function of
Poverty

CRCHUM

Université 
de Montréal

Interpretation: GFC as experienced in Québec & Child Health in the QLSCD

- On average, the likelihood of being perceived in less than very good health appeared to **increase** between 2010 and 2013 among children of poor families.
- The mean number of youth self-rated depressive symptoms may have **increased** or remained **stable** between 2008 and 2011.
- The mean score of youth self-rated proactive aggressive behavior may have **decreased** or remained **stable** between 2008 and 2011.

Results

How Poverty and Child Health
are associated between 2008
and 2014 while controlling for
Poverty Before 2008

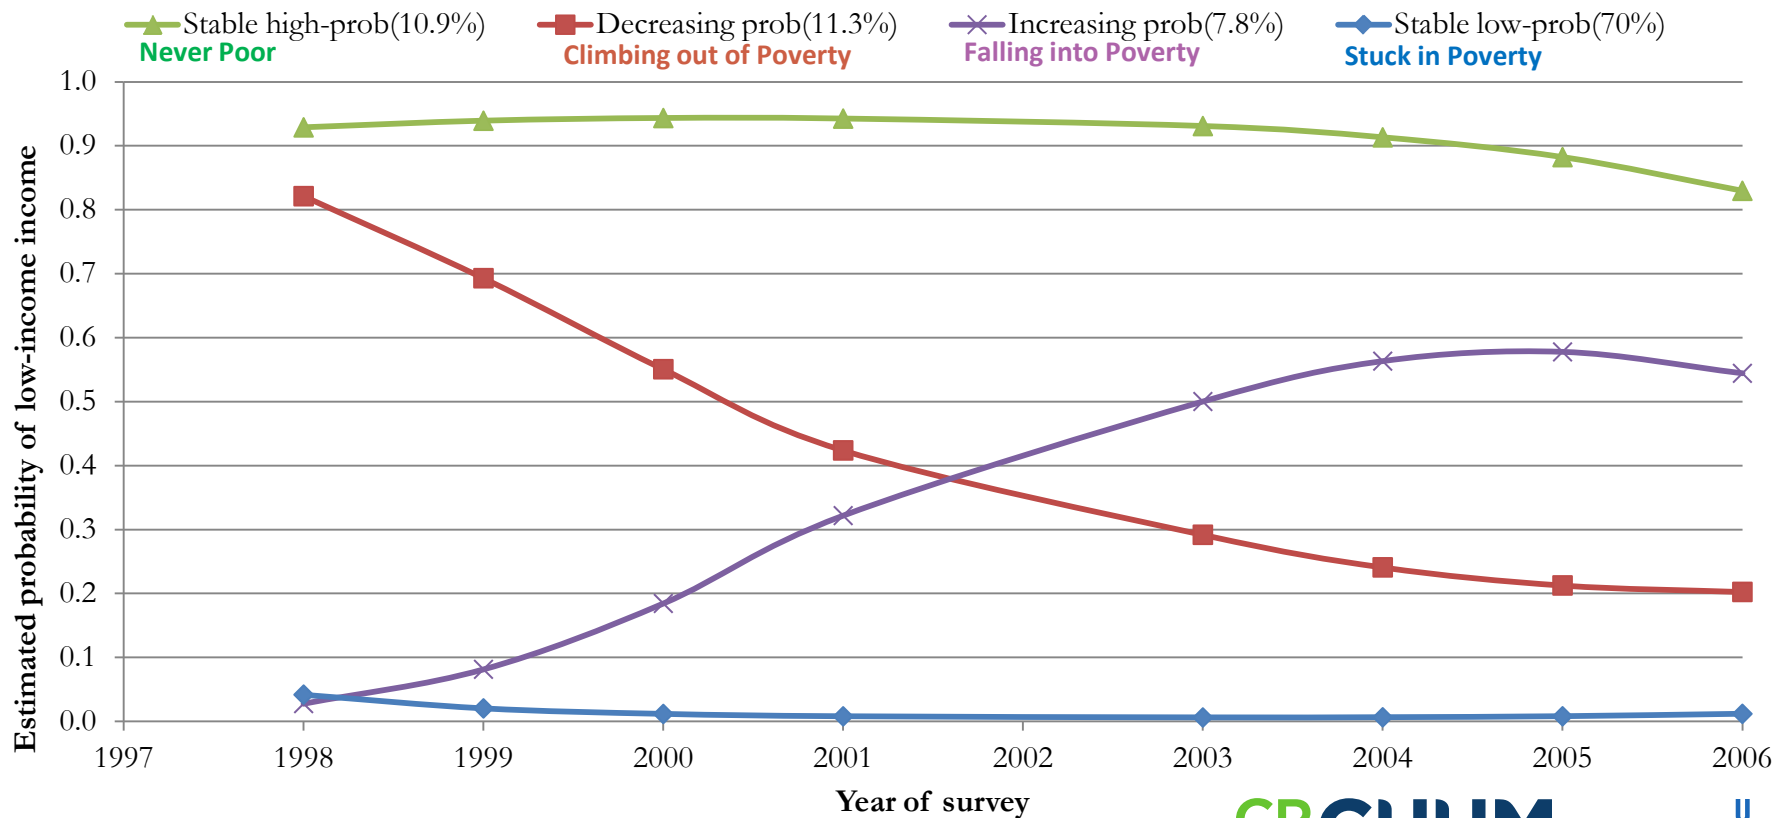

CRCHUM

Université 
de Montréal

How we created Indicators of Previous Deprivation

- Latent class analyses
 - Never poor
 - Climbing out of poverty
 - Falling into poverty
 - Stuck in poverty
- Estimated for Low-income & Lowest-SES (not shown)

Trajectories of Low-Income based on the Most Likely Class Membership, QLSCD, 1998-2006

Interpretation

How Poverty and Child Health
are associated between 2008
and 2014 while controlling for
Poverty Before 2008

CRCHUM

Université 
de Montréal

Interpretation: GFC as experienced in Québec Low-Income & Child Health in the QLSCD

- Statistically **significant unadjusted** associations between low-income from 2008-2013 and health (concurrent and lagged associations)
- However, **none** of the health indicators were significantly associated with concurrent & lagged measures of low-income once pre-2008 low-income trajectories were accounted for.

Interpretation: GFC as experienced in Québec SES & Child Health in the QLSCD

- Pre-2008 Exposure to Poverty and Lower SES
 - Associated with an increased risk of reporting *less than very good* perceived health, greater *depressive symptoms*, and greater *proactive aggressive behavior*
 - Associations are stronger for concurrent than lagged poverty (and SES)

Interpretation: GFC as experienced in Québec SES, & Child Health in the QLSCD

- No associations of SES with likelihood of being perceived in *less than very good health* & with self-rated *depressive symptoms* after accounting for pre-2008 exposure to poverty.
- Lowest SES quintile associated with increased risk of self-rated *proactive aggressive* behavior even after accounting for pre-2008 exposure to deprivation

Cautious Conclusions

CRCHUM

Université 
de Montréal

Cautious Conclusion: Impact of GFC on Child Health in the QLSCD

- No evidence of overarching effects of the GFC as experienced by participants in the QLSCD
- Possible exacerbation of poverty among youth of lower-educated mothers
- Possible deleterious effects of deprivation on youth self-reported *proactive aggressive* behavior.
- Yet, difficult to attribute any effects to GFC as alternative explanations for findings are possible.

Cautious Conclusion: Impact of GFC on Child Health in the QLSCD

- Possible explanations
 - Crisis was less severe in Canada than in the USA;
 - Stable & less deregulated banking system;
 - Instead of austerity policies at the federal level, in Québec
 - a province-wide infrastructure program (already adopted before the crisis)
 - adopting a universal low-fee daycare program is known to stimulate mothers' (particularly single mothers') participation in the labor market.

Acknowledgments

- ✓ Analyses funded by the *Canadian Institutes of Health Research* Grants #200309MOP-123079 and #200609MOP-165867

- ✓ The *Institut de la Statistique du Québec, Direction Santé Québec* was responsible for the data collection and validation of the data base.

Cautious Conclusion: Impact of GFC on Child Health in the QLSCD

- Yet
 - Possible exacerbation of deprivation among youth of low-educated mothers
 - Possible deleterious effects on youth self-reported *proactive aggressive* behavior.
- Not aware of any studies in Canada or in Québec to compare with
- Possibly consistent with evidence of
 - worsened economic hardship among vulnerable groups documented in some developed countries
 - deleterious impact of GFC on mental health documented in some developed
 - perceived economic uncertainty increased risk of behavioral problems among 9-year-old children in the USA, particularly among boys of single-parent-families

Cautious Conclusion: Impact of GFC on Child Health in the QLSCD

- Overall, it is difficult to attribute any (small) effects to GFC with our dataset
 - Counterfactuals are not readily available
 - We likely lack statistical power
