Department of Psychoeducation, University of Sherbrooke 16th INRICH Workshop, Liverpool (United Kingdom)

CONTEXT

- The first 1000 days of life are decisive in shaping language development.¹ Inequalities in a child's environment during this sensitive period can lead to later difficulties.²
- Child development may be positively influenced through increased time parents spend with their newborn³ during paid parental leave (PPL).

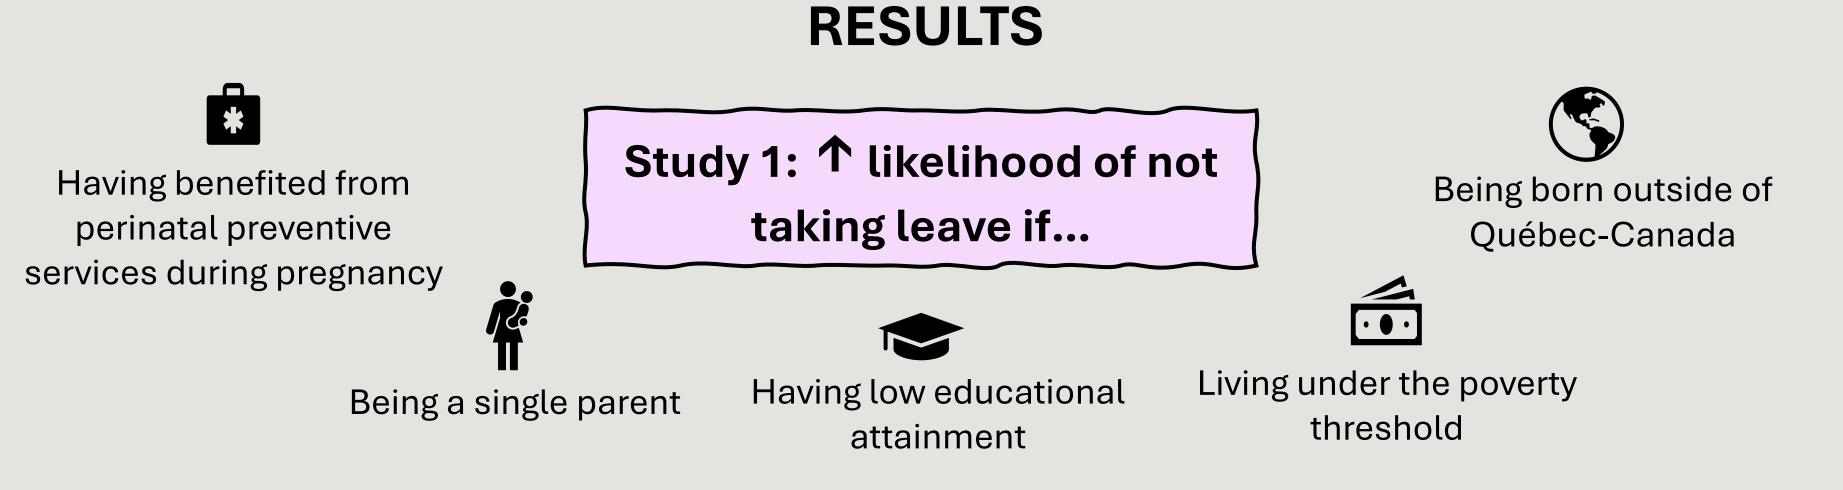

Table 1. Descriptive statistics by PPL users

- Further research is needed on how social determinants of health contribute to variations in paid parental leave uptake.⁴
- Additionally, parental practices adopted during PPL - such as early exposure to books - may contribute to language development.⁵

OBJECTIVES

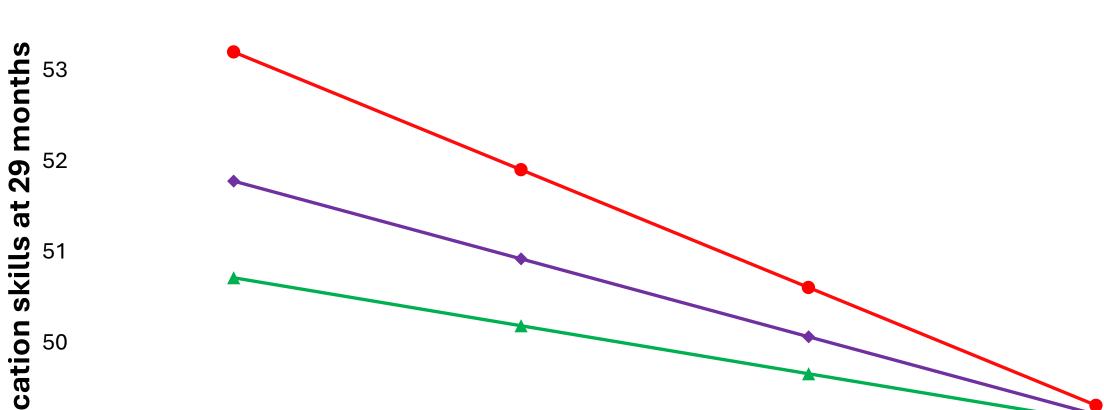

- **Study 1:** Examine how social determinants of health contribute to variations in the uptake of paid parental leave among mothers.
- **Study 2:** Prospectively investigate the moderating role of PPL duration for both parents in the association between the age of first exposure to books and language skills.

METHODS

	1. No leave (n=299, 8.6%)	2. Maternity leave only (n=80, 2.3%)	3. Maternity & non- shared parental (n=1927, 55.8%)	4. Maternity & shared parental (n=1150, 33.3%)	Anova / Chi-square
Age of first exposure to books (months; M [SD])	4.21 (4.24)	4.52 (4.52)	3.59 (3.57)	3.52 (3.52)	1=2<3=4 <i>p</i> <.001
Communication subscale (M [SD])	50.05 (12.05)	52.14 (13.73)	54.17 (9.82)	53.50 (10.81)	1<3=4 p<.001
Living below poverty threshold	46.6%	22.2%	9.1%	8.8%	1>2>3=4 <i>p</i> <.001

Study 2

Graphic 1. Moderation between age of exposure to books and language skills at 29 months by PPL duration of the mother (model 1 with PROCESS 2.4; Hayes, 2022)

★15 weeks (slope = -.27, p =.083) → 30 weeks (slope = -.42, p <.001) ←50 weeks (slope = -.65, p <.001)

Sample 1 consists of 3456 children (49.3% boys) and their mothers participating in the Québec Longitudinal Study of Child Development 2nd Edition ([QLSCD-2], Canada).

Sample 2 consists of 2204 children and their parents participating in the QLSCD-2 study, for whom administrative data are available.

Measures

- Parental leave
- Study 1: uptake reported by the mother at 17 months postpartum (received maternity benefits yes/no, shared parental benefits with the co-parent yes/no) • Study 2: administrative data for PPL duration
- (weeks) for both parents
- Child : eg., sex, gestational age, Apgar
- Maternal: eg., age, country of birth, education, habits during pregnancy
- Family: eg., structure, income
- Perinatal health services: eg., preventive

	Age of first exposure to books					

The average duration of PPL was 43.77 weeks for mothers and 8.03 weeks for fathers. After controlling for the child's sex and the co-parent's PPL duration, the association between the age of first exposure to books and language skills at 29 months was moderated by the mother's PPL duration (p=.03), but not by the father's duration (p=.14). A minimum of 17.8 weeks of maternal PPL was required to observe a significant impact.

DISCUSSION

Key findings

54

at 29

- Mothers in the "No leave" group are more likely to experience increased socioeconomic hardship.
- Mothers planning to take an extended period of PPL are more likely to introduce books earlier.
- Mothers play a particularly influential role in early language development through reading. Nevertheless, both parents should be encouraged to actively engage in shared book reading during this period, as it may represent a critical window for supporting language outcomes.
- From a public health perspective, it is essential to promote access to policies that support child development, particularly among families who stand to benefit the most from such programs.

Strengths & Limitations

determinants

Social

withdrawal, food aid

• Communication subscale (Ages & Stages Questionnaires, 3rd edition)⁶

• Age of first exposure to books (in months)

Acknowledgments

Language

The authors want to acknowledge the contribution of statisticians and other professionals from the Institut de la statistique du Québec in the data collection. The authors would also like to acknowledge the crucial participation of parents and their children in QLSCD-2.

+ Updated and contemporary portrait, drawing from a prospective population-based cohort of children

+ Use of socioecological framework to examine parental leave uptake

- Data collection during the COVID-19 pandemic, which has altered the labor force participation and PPL uptake^{7,8}
